For further copies of this form please apply to the above address.

## **Timing of Vaccinations**

The available vaccines for BVD now have a general recommendation that no other vaccine should be administered within 14 days before or after vaccination with the product. This creates difficulties where there is to be a signed veterinary declaration that vaccination has taken place, as with multiple vaccinations four vet visits will be required rather than two where vaccination against a single disease is to be carried out.

You should note that we are neither encouraging the use of vaccines contrary to the manufacturers' instructions nor are we advocating that all animals should be vaccinated prior to a sale. We advise that if animals are vaccinated the information on the vaccines used should be made available to potential buyers.

We also recommend that where vaccination is considered then BVD is the most important vaccine from the perspective of selling bulls through market. Of the other vaccines, IBR is next in importance.
